Portfolio

Portfolio Value & Operations

Operating decisions across the estate: cost, service, productive use and asset value

Portfolio: Needs attention

3 simulated sites · 1 mini-grid / 1 cold room / 1 charging hub

Assessment scope & periods ↗

Grow revenue →

Capture more value from existing infrastructure and expand earning potential

18–20 kW unused

Productive use at Kobo · idle chargers at Depot · site income not recorded

Kobo · GreenHarvest · Depot

Opportunities · revenue not measured yet

Optimize cost and efficiency →

Eliminate avoidable expenditure and get more output from operational resources

$3.31–3.97

Kobo generator time, 1 trial in hand · 3 repair visits without a result at GreenHarvest, cost not recorded

Kobo · GreenHarvest · Depot

Modelled + scenario · one-hour window · reliability checked as a safeguard

Protect asset and capital →

Preserve asset value, avoid premature replacement and reduce service disruption

2 sites disrupted

Cold-room exposure · interrupted charging · 4 early warnings on battery, generator, charger and backup · Depot peak at 95% of its limit

Kobo · GreenHarvest · Depot

Measured events and early warnings, counted separately · loss not priced

Assure performance and returns →

Establish with defensible evidence whether the infrastructure is delivering expected results

Not established

No verified result yet · no targets declared · evidence gaps at all 3 sites

Kobo · GreenHarvest · Depot

Completed work does not establish savings

3 priority sites · **1** opportunity · **3** site evidence gaps · **3** accepted actions · **8** warnings not yet priced

Distinct consequence categories · no combined savings total

Where management should act first

Findings ranked by consequence and urgency, with evidence confidence alongside.

6 FINDINGS

All priorities | Cost | Risks | Opportunities

6 findings

SITE	FINDING / OPERATING MECHANISM	VALUE / CONSEQUENCE	PRIORITY	CONFIDENCE	ACTION / NEXT MOVE
GreenHarvest Cold-chain	**Backup response failed** F-118 · Automatic start failed; cooling interrupted Protect asset and capital · Optimize cost and efficiency	**Product conditions exposed** Measured peak 8.2°C · loss unpriced 6 Oct · 19:00–20:00	High	High Observed sequence	**ACT-051** Witness an automatic-start test Open
Kobo Mini-grid	**Extended generator support** F-104 · 30 min candidate; charging trade-off remains Optimize cost and efficiency · Protect asset and capital	**$3.31–3.97** Modelled fuel + scenario maintenance 6 Oct · 14:20–15:20	High	Low ⓘ PCS capability gap	**ACT-048** Verify the policy trial Outcome pending
Depot EV charging	**Charging session interrupted** F-130 · Fault-aborted session; root cause unknown Protect asset and capital · Grow revenue	**1 interrupted session** Measured events · revenue loss unpriced 6 Oct · 08:00–16:00	Medium	Medium ⓘ 1 other outcome unknown	**ACT-061** Investigate connector 2 Open
GreenHarvest Cold-chain	**Temperature excursion** F-119 · Chamber above 4°C after backup failed Protect asset and capital	**25–35 min above policy** Measured peak 8.2°C · no spoilage determination 6 Oct · 19:00–20:00	Medium	High Stock and loading not recorded	**Review recommendation** Record stock and connect the door log Open
Kobo Mini-grid	**Battery output-limit report missing** F-108 · One 14:50 report absent from the battery controller Assure performance and returns · Optimize cost and efficiency	**30 min unclassified** Evidence gap · limits F-104 6 Oct · 14:20–15:20	Medium	High Reporting cause unknown	**ACT-049** Restore battery-limit reporting Open
Kobo Mini-grid	**Productive-use headroom** F-109 · Recurring renewable capacity available Grow revenue · Optimize cost and efficiency · Protect asset and capital	**18–20 kW usable** Modelled headroom · $2.50 scenario sales Separate 5-day study · 3 eligible days	Medium	Medium ⓘ Demand not established	**Review recommendation** Evaluate a 10 kW productive load Recommendation

Early warnings · not priced yet

Risk — **Repeated maintenance without a result**
GreenHarvest · Optimize cost and efficiency · Backup generator visited 3 times in 60 days (14 Aug, 18 Sep, 6 Oct); the automatic start still failed

Early warning — **Battery below its reserve**
Kobo · Protect asset and capital · 5 of the last 30 days · lowest 22%

Early warning — **Backup start test overdue**
GreenHarvest · Protect asset and capital · Monthly test due 2 Oct, not done

Early warning — **Charger fault and overdue inspection**
Depot · Protect asset and capital · Connector 2 fault on 6 Oct · inspection overdue since 30 Sep

Sites › Kobo Mini-grid › Overview

Kobo Mini-grid

Simulated site · MG-DEMO-01

60 kWp PV · 200 kWh battery · 40 kW genset · residential, clinic & grain mill

Overview | Foundation | Health | Performance | Findings | Work | Financials | Evidence

Needs attention · Confidence: Low ⓘ · Assessed this hour: dispatch only · other objectives need more evidence · Inspect evidence ↗

Objective: serve residential, clinic and productive loads while protecting a 30% battery reserve.

How this site is doing

Grow revenue

Capture more value from existing infrastructure and expand earning potential

Opportunity — 18–20 kW of daytime solar unused

1 issue

Optimize cost and efficiency

Eliminate avoidable expenditure and get more output from operational resources

Needs attention — $3.31–3.97 exposure in this hour

2 issues · 1 in hand

Generator ran 30 minutes longer than the load needed · seen on 24 of the last 30 days

Must not harm Reliable service and battery life are checked as safeguards in the generator trial; a fuel saving that harms them does not count

WHAT DRIVES IT

Generator use — 30 min avoidable, 30 min unclear — Low ⓘ

Fuel — No complete fuel balance yet — Unknown

Fuel price — Declared at $1.20 per litre — Declared

ISSUES

Finding F-104 · Generator support review

Finding F-108 · Battery report missing limits this conclusion

WHAT CAN BE DONE

Trial a lower generator stop setting

Proposed setting change CHG-019

ALREADY IN HAND

ACT-048 · Generator stop trial — Plan ready

EARLIER INTERVENTIONS

No earlier change has been checked at this site

Dispatch evidence →

Protect asset and capital

Preserve asset value, avoid premature replacement and reduce service disruption

Watch — 2 early warnings on battery and generator

3 issues · 2 in hand

Assure performance and returns

Establish with defensible evidence whether the infrastructure is delivering expected results

Watch — No verified result yet · confidence low for this hour

1 issue · 1 in hand

What happened in the selected hour

Plain sequence from accepted readings · the dispatch view has the detail

Open Dispatch →

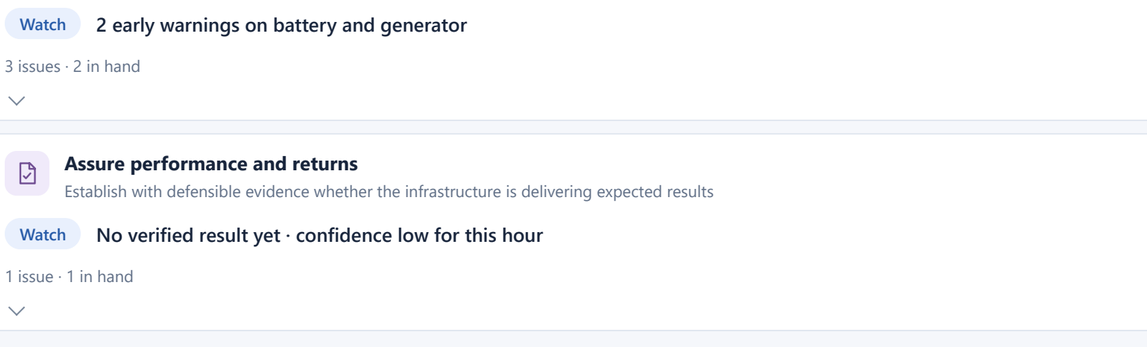

14:20	14:20	14:20–15:20	14:50	15:20
Generator running at 18 kW	**Sun and battery could carry the 30 kW load**	**Generator output kept charging the battery**	**Battery output-limit report missing**	**Generator still running**
Generator controller	42 kW solar available · battery 74%	Battery 74% → 88%	Battery controller	Stop setting is 90% battery charge

The generator kept running because its stop setting is 90% battery charge, not because the load needed it. Its output went into the battery.

Operating context

Selected hour · context for the cards, not a status source

Single line diagram →

Dots are readings every 15 minutes. Dotted lines join readings; they are not continuous measurement.

Needs attention

1. **Generator ran longer than needed**
   Solar and battery could carry the load in two 15-minute blocks (F-104).
   Performance › Dispatch →
2. **A battery report is missing**
   The 14:50 battery output-limit report is absent, so 30 minutes stay unclear.
   Evidence →
3. **Check the charging trade-off**
   Generator energy charged the battery. Net savings are not yet shown.
   Financials →

Bounded money consequence

$3.31–3.97

Cost exposure for the avoidable 30 minutes: modelled fuel plus a maintenance allowance. **Not realised savings.**

Open financial bridge →

Next step

Review the 90% generator stop setting

Trial a lower stop setting and judge it on generator time, service, battery reserve and stored energy together.

Review recommendation

Kobo Mini-grid

Simulated site · MG-DEMO-01

Performance · renewable use and productive-load opportunity

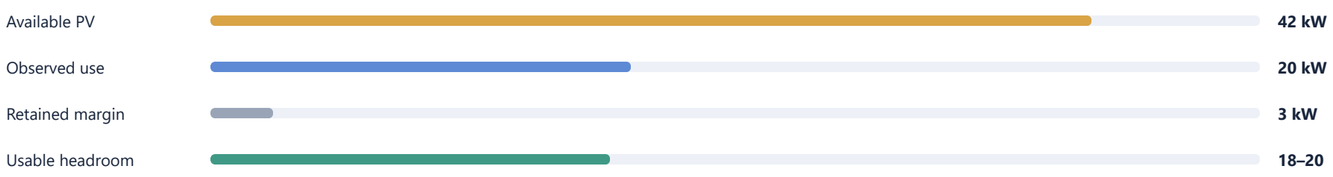

Watch | Confidence: Medium ⓘ | Lens: Opportunity | Solar left unused on 3 of 5 adequately observed days · separate 5-day study

Compare with Dispatch evidence →

PV capability	PV used	Usable headroom	Recurring opportunity
42 kW	20 kW	18–20 kW	3 / 5 days
Reported capability; ±1 kW model allowance	Measured output in eligible windows	After a 3 kW operating margin	One eligible hour per qualifying day

From physical headroom to an opportunity

Actual one-minute means cover each eligible one-hour window

[41, 43] kW capability bound − 20 kW load − 3 kW margin = 18–20 kW. No charging obligation or critical service deficit is evidenced in eligible windows.

Productive-use evaluation

Electrical feasibility does not establish customer demand

ILLUSTRATIVE GRAIN MILL

10 kW × 1 h

Up to 10 kWh of additional served energy. At a scenario tariff of $0.25/kWh: **$2.50 gross sales**, before other costs.

Inspect opportunity constraints ↗

Eligible and excluded windows

DAY / PERIOD	OPPORTUNITY	CONSTRAINT CHECK	DECISION
Day 1 · 12:00–13:00	18–20 kWh	Storage charge acceptance 0; service covered	Eligible
Day 2 · 12:00–13:00	—	Storage charging obligation	Excluded

Generator support merits review

F-104 · Kobo Mini-grid · generator dispatch · 6 Oct 2026

Open site

Overview | Analysis | Evidence | Alternatives | Recommendation | History

AFFECTS **Optimize cost and efficiency** supply cost per kwh · ALSO CHECK **Protect asset and capital** reliable service, battery and generator life · Seen on 24 of the last 30 days

Priority: High · Confidence: Low ⓘ · State: Open · Claim: Candidate avoidable · Lens: Cost · Kobo Mini-grid · Dispatch · 6 Oct 14:20–15:20

What happened

Selected hour · 14:20–15:20 EAT

Inspect evidence ↗

The generator remained online while PV and battery capability appeared sufficient for observed load in two supported portions.

30 minutes are classified Candidate avoidable. A further 30 minutes remain Indeterminate because a PCS capability report is missing.

Candidate runtime	Associated fuel	Cost exposure	Capability support
30 min	2.43–2.97 L	$3.31–3.97	4 / 5
Derived under declared continuity assumptions	Modelled; not fuel-meter measurement	Modelled fuel + scenario maintenance	PCS report endpoints; 2 of 4 segments supported

What limits this conclusion

Useful battery charging is an alternative explanation. A lower generator runtime can leave less stored energy for later service.

Missing capability and 25 minutes of episode transition uncertainty lower confidence. No observed override record does not prove that none existed.

See analysis and alternatives →

What to do next

Review the generator stop threshold

Test the policy with declared service, reserve and terminal-energy guardrails. Verify using a later accepted evidence window.

Constraint comparison

Selected 14:20–14:35 interval

OBSERVED / DECLARED INPUT	VALUE	TEST	RESULT
Delivered load	30 kW	Compare to capability baseline	Observed
PV available	42 kW	42 ≥ 30 × 1.1	Supported
PCS discharge capability	30 kW	Both interval endpoints required	Supported
Battery SOC / reserve	74% / 30%	SOC exceeds reserve + 10 points	Supported
Minimum runtime	30 min	Already elapsed at selected interval	Not binding
Generator stop threshold	90% SOC	Reported policy explains continued operation	Alternative

Bounded fuel calculation

```
Candidate duration     0.50 h
Generator output         18 kW
Public fuel coefficient 0.30 L/kWh
Declared model band       ±10%

0.50 × 18 × 0.30 × [0.9, 1.1]
= 2.43–2.97 L
```

Fuel associated with candidate operation. It is not a counterfactual avoided-fuel calculation.

Coverage, confidence and alternatives

ISSUE	EVIDENCE INTERPRETATION	EFFECT
PCS report absent at 14:50	Two adjacent segments require the missing endpoint	30 minutes Indeterminate
Start / stop timing	15 minutes start uncertainty + 10 minutes stop uncertainty	Episode confidence lowered
Battery charging	Generator supplied energy into storage	Net savings remain unverified
Operator override	No effective override record observed in selected interval	Unobserved override not excluded

ⓘ Finding classification is produced by backend analytics. The Site card, Financials page and frontend chart must consume this result rather than re-derive it.

Canonical basis: v6.9 8.32 · 8.37 · **Question:** How do the measurements lead to the classification?
Preserved: Canonical root ownership, bounded claims, explicit evidence quality and contextual drill-down.
Adapted: Analysis is a deliberate additional Finding contextual tab. No additional subtab row is introduced.
Deferred: Capabilities without a supporting data contract stay outside the implemented demo slice.

Generator support merits review

F-104 · proposed policy intervention and declared success criterion

Open site

AFFECTS **Optimize cost and efficiency** supply cost per kwh

ALSO CHECK **Protect asset and capital** reliable service, battery and generator life

Seen on 24 of the last 30 days

F-104 · Recommendation — Policy review; not a diagnosis of controller malfunction

Proposed intervention

Trial a lower generator stop threshold.

Review moving the stop threshold from **90% to 70% SOC** while retaining the 30% reserve and 30-minute minimum runtime. Record the applied configuration and observe a later comparable period.

Suggested owner	**Site controls lead**
Action type	**Policy review / supervised trial**
Origin	**F-104 · retained analytic revision**
Configuration change	**CHG-019**

Accept example recommendation

Declare success before evaluating

ROLE	CRITERION
Target	Candidate runtime reduced by at least 25%
Guardrail	No new battery reserve breaches
Guardrail	No increase in critical service deficit
Guardrail	Comparable terminal storage and energy context
Evidence	Adequate matched-window coverage; confounders reviewed

ⓘ Acceptance creates managed work. It does not close the Finding, verify the change or send a real controller command.

Evidence needed to verify

1 **Applied configuration record**
Time-valid policy change and authority retained.
Inspect change →

2 **Later operating evidence**
Accepted reports in a later operational window; comparison worlds stay separate.
Inspect verification →

Canonical basis: v6.9 8.32 · 8.38 · **Question:** What action should be accepted, and how will success be judged?
Preserved: Canonical root ownership, bounded claims, explicit evidence quality and contextual drill-down.

Grid supply lost	**Compressor stopped; battery holds controls**	**Automatic start requested**	**Generator failed to start**	**Started by hand**	**Cooling running again**	**Peak 8.2°C**	**Back within 2–4°C**
Site power meter	By design at night · inverter-charger	Generator controller	Generator controller	Operator log	Compressor meter	Chamber probe	Chamber probe

Grid power was lost after dark, when solar was not producing. As designed, the battery kept controls and alarms running while the compressor waited for the generator — but the generator did not start on its own. Cooling stopped for four minutes until it was started by hand, and the chamber stayed above 4°C for 25–35 minutes.

Chamber temperature

Operating conditions, not an inventory-loss model

Single line diagram →

Policy band 2–4°C. Shaded area: time above the limit, bounded by 5-minute readings.

Needs attention

1. **ACT-051 · Witness an automatic-start test**
   The starter inspection is done, but no test shows backup works again.

Power outage	Observed · 19:11 · backup failed →
Door opening	No record · door log not connected
Loading / batch	Not established
Defrost	No record observed

Open Incident INC-203 →

ⓘ Durations are bounded by the 5-minute reading spacing. Exposure size is bounded the same way (lowest and highest reading in each 5-minute step); it does not describe what happened to the product.

Claim boundary

The accepted probe and power records support a temperature excursion during a backup interruption. Product-specific quality or spoilage conclusions require product identity, exposure policy and additional evidence.

Canonical basis: v6.9 8.29 · **Question:** How far and how long did temperature exceed policy?

Preserved: Excursions and exposure remain bounded by actual temperature evidence and configured policy.

Adapted: Duration, in-policy share and exposure size are computed from the 5-minute readings as bounded ranges (duration bracketed by readings; °C·min bounded by the lower and upper reading in each 5-minute step (50–90), replacing the earlier ≈70 straight-line point estimate) rather than v6.9 point values.

Deferred: Spoilage determination and unverified exposure valuation.

Content owners: TemperatureExcursion · PolicyVersion · AcceptedEvidence · **Prototype route:** #/temperature

GreenHarvest Cold Room

Simulated site · CR-DEMO-01

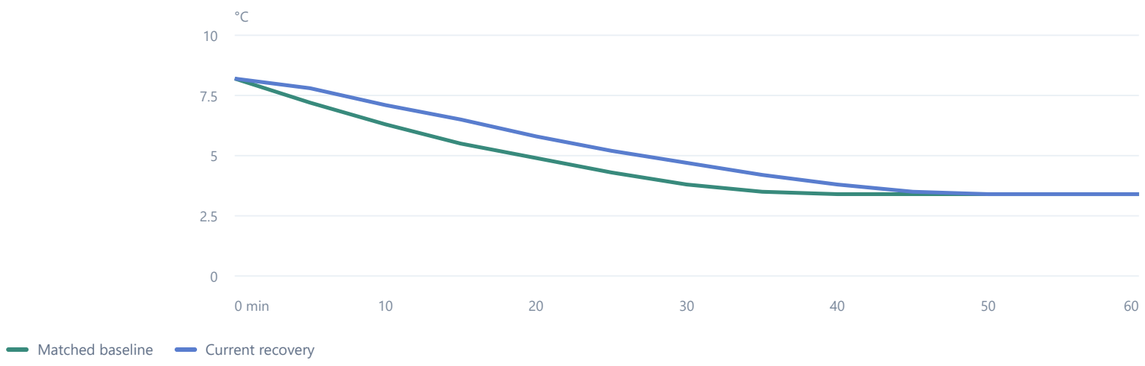

Performance · recovery under comparable conditions

Comparison limited · Confidence: Low ⓘ · Illustrative recovery curves · loading context not matched · Inspect recovery basis ↗

Usual time back to 4°C	This time back to 4°C	Difference	Comparable?
36 min	42 min	+17%	Not yet
Earlier comparable recoveries · illustrative	Recovery after cooling restarted · illustrative	A description, not a diagnosis	Loading and door records missing

Recovery curves

Example curve shapes; selected event-to-policy recovery

Context normalization

FACTOR	EVIDENCE	MATCH
Ambient temperature	29–32°C	Matched
Power availability	Continuous during recovery	Matched
Door-open duration	Limited record	Limited
Loading / batch	Not established	Unknown
Defrost	No event observed	Not excluded

ⓘ These examples do not support a definitive cooling-degradation or compressor-failure conclusion. Obtain comparable loading and door context before upgrading the claim.

Next best evidence

1 **Repeat a comparable recovery test**
Record load, door opening, ambient conditions, defrost and cooling energy.
Plan a witnessed test →

2 **Inspect the excursion chain**
Check whether lost power, rather than refrigeration condition, explains the event.
Open Backup →

Canonical basis: v6.9 8.30 · **Question:** Is recovery slower under comparable operating conditions?
Preserved: Context normalization precedes a degradation claim.
Adapted: Shows an evidence-limited comparison so similar curves cannot imply a false diagnosis.
Deferred: Automatic compressor diagnosis.
Content owners: CoolingRecoveryWindow · ContextMatch · ClaimLineage · **Prototype route:** #/cooling

GreenHarvest Cold Room

Simulated site · CR-DEMO-01

Performance · grid outage to cooling-service recovery

Degraded · Confidence: High · One outage in the selected hour · automatic start failed · recovered by hand · Open INC-203 →

What the chain shows

The backup failed; the refrigeration did not.

The battery held controls and alarms as designed. The compressor restarted within a minute of generator power reaching it at 19:15, and the chamber was back within policy by 19:45. The evidence points to the generator's automatic start, not the cooling plant or the solar-battery system. Which starter part failed still needs inspection.

Grid-loss event	Automatic start	Manual recovery	Cooling resumed
19:11	Failed	19:14	19:15
Site power evidence	Command and controller status observed	Operational record	Compressor meter / status

Reconstructed event chain

19:11	19:11	19:11:05	19:11:10	19:14	19:15	19:19	by 19:45
Grid supply lost	**Compressor stopped; battery holds controls**	**Automatic start requested**	**Generator failed to start**	**Started by hand**	**Cooling running again**	**Peak 8.2°C**	**Back within 2–4°C**
Site power meter	By design at night · inverter-charger	Generator controller	Generator controller	Operator log	Compressor meter	Chamber probe	Chamber probe

Backup event chains

Same chain as the mini-grid Backup view · no other outage in the selected hour

WHEN	GRID	START REQUESTED	GENERATOR	POWER TO LOAD	LOAD RESPONSE	OUTCOME FOR SERVICE	RESULT
6 Oct 19:11	Lost	Seen 19:11:05	Start failed	Generator path restored 19:14 by hand · transfer record missing	Compressor shed 19:11 (battery holds controls) → running 19:15	Above 4°C for 25–35 min	Fail

Evidence by causal step

STEP	ACCEPTED OBSERVATION	WHAT IT ESTABLISHES	LIMIT
Grid supply	Lost at 19:11	Supply interruption	Not the root cause of controller failure
Start command	Seen at 19:11:05	An automatic start was requested	Does not identify the defective part
Generator	Failure status at 19:11:10	Start did not succeed	Starter fault requires investigation
Power / compressor	Cooling resumes at 19:15	Service was restored	Transfer-path detail may remain incomplete
Temperature	Peak 8.2°C at 19:19	Bounded exposure consequence	No spoilage determination

ⓘ The backup chain and temperature consequence share evidence references. A maintenance completion leaves the Finding open until a declared outcome test passes.

Canonical basis: v6.9 8.31 · **Question:** What failed between loss of grid and restored cooling?
Preserved: Canonical root ownership, bounded claims, explicit evidence quality and contextual drill-down.
Adapted: States the 8.31 discrimination (backup versus refrigeration failure) in one plain sentence; shares the backup chain table with the mini-grid; the missing transfer record is shown as an explicit missing link.
Deferred: Capabilities without a supporting data contract stay outside the implemented demo slice.

Bounded money consequence

$36.00

Gross tariff estimate for 120 kWh delivered in complete sessions at a $0.30/kWh scenario tariff. **Not cash collected.** The interrupted session is not priced: unmet demand is not established.

Open financial bridge →

Next step

Check connector 2 and witness a full session

Retrieve the fault log for SES-011, then run a complete session on connector 2 with start, end and meter records.

Review recommendation

Canonical basis: v6.9 2.2 / 2.4 pattern · EV extrapolation · **Question:** Can drivers charge, and what constrained their service?
Preserved: Stable Site / Asset / Finding shell, evidence ceilings and bounded financial translation.
Adapted: EV is extrapolated (v6.9 has no EV section). Uses the shared site-overview skeleton; sessions, connector availability and site power replace mini-grid dispatch content; cards use canonical assessments only.
Deferred: Roaming, billing settlement and vehicle-battery health.
Content owners: SessionServiceWindow · ConnectorAvailabilityWindow · ChargingEnergyWindow · **Prototype route:** #/ev

Depot Charging Hub

Simulated site · EV-DEMO-01

Performance · charging sessions and delivered service

Service needs attention — 12 attempts · keep incomplete records separate from observed outcomes — Inspect session lineage ↗

Attempts	Confirmed delivery	Fault-aborted	Incomplete
12	10	1	1
Accepted session starts	Completed with delivered-energy evidence	Observed fault and stop event	End record absent; outcome unknown

Session service records

120 kWh is the summed metered energy in complete records, including the aborted session; the incomplete session is excluded

SESSION / CONNECTOR	PERIOD	ENERGY	OUTCOME	EVIDENCE COMPLETENESS	NEXT STEP
SES-010 · connector 1	13:12–13:46	18.4 kWh	Delivered	Start, end and meter records	Inspect records ↗
SES-011 · connector 2	14:03–14:11	3.6 kWh	Fault-aborted	Fault, stop and meter records	**Review connector →**
SES-012 · connector 2	15:04–unknown	Unknown	Incomplete	End record absent	Inspect missingness ↗
9 earlier completed sessions	08:00–13:05	98.0 kWh	Delivered	Completed records present	**Energy summary →**

How to read the denominator

10 confirmed completions + 1 observed failure + 1 unknown = 12 attempts. Do not collapse unknown into a failure or present a success percentage without stating its denominator.

Cause remains bounded

A fault event establishes interruption. Low charging power alone would not establish site-power constraint: vehicle acceptance, requested current and control-limit records are needed.

Canonical basis: v6.9 2.2 pattern · 8.32 / 8.35 · EV extrapolation · **Question:** Which sessions completed, failed or remain unknown?
Preserved: Outcomes are evidence-derived, with unknowns preserved.
Adapted: New EV read models use canonical Finding and Evidence detail.
Deferred: Billing settlement and unobserved session energy.
Content owners: ChargingSession · SessionServiceWindow · AcceptedEvidence · **Prototype route:** #/sessions

Depot Charging Hub

Simulated site · EV-DEMO-01

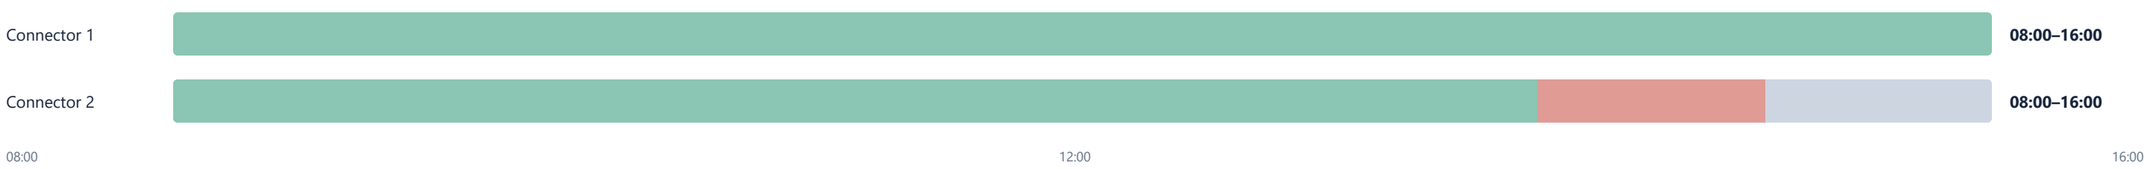

Performance · connector availability and unknown time

Evidence limited — 2 connectors × 8 scheduled hours = 16 connector-hours

Known available	Known unavailable	Unknown	Known-time availability
14 connector-h	1 connector-h	1 connector-h	93.3%
State-supported service time	Faulted or unavailable state evidenced	No trustworthy state coverage	14 / 15 known hours; coverage 93.75%

Connector states over the service schedule

Available · Unavailable · Unknown

Connector 2: 6 h available, 1 h observed unavailable and 1 h unknown. Aggregated spans are illustrative; production uses accepted transition timestamps.

Full-schedule availability bound

87.5–93.75%

Lower bound: 14 / 16 hours. Upper bound: (14 + 1 unknown) / 16. Unknown time is not silently included as available.

Most useful next evidence

Recover the connector status/heartbeat history for the missing hour. A telemetry outage does not prove the charging connector was physically unavailable.

Inspect connector-state lineage ↗

Canonical basis: v6.9 8.35 pattern · EV extrapolation · **Question:** Was each connector available during its intended service hours?
Preserved: Canonical root ownership, bounded claims, explicit evidence quality and contextual drill-down.
Adapted: A scheduled-service denominator replaces mini-grid served-load semantics.
Deferred: Capabilities without a supporting data contract stay outside the implemented demo slice.
Content owners: ConnectorAvailabilityWindow · ServiceSchedule · **Prototype route:** #/availability

Depot Charging Hub

Simulated site · EV-DEMO-01

Performance · charging energy and site-power context

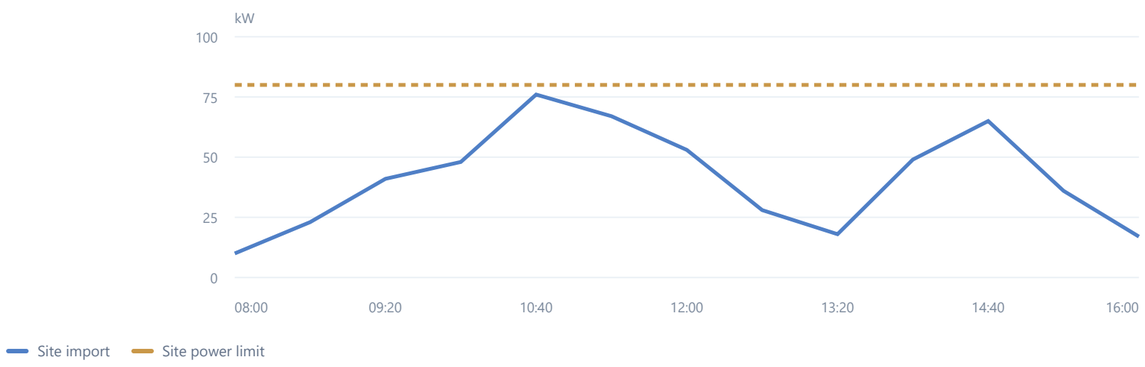

Energy basis: measured — Complete session meter records · incomplete session energy excluded

Inspect meter basis ↗

Metered session energy	Observed peak import	Declared site limit	Gross tariff estimate
120 kWh	76 kW	80 kW	$36.00
Includes 3.6 kWh from aborted session	Selected 8-hour window	Time-valid configuration	Scenario tariff: $0.30/kWh

Import power and configured limit

Observed import is not proof of vehicle-requested power

What can be concluded

Observed peak below limit	Yes
Site limit caused interruption	Not established
Requested vehicle power	Incomplete evidence
Stationary battery	Not configured
Billing settlement	Not connected

Revenue is an estimate from metered kWh and the declared tariff, not payment evidence.

Technical-to-financial bridge

QUANTITY	ASSUMPTION	RESULT	LIMIT
120 kWh complete-record delivery	$0.30/kWh scenario tariff	$36 gross estimate	No collections or profit claim
Incomplete session	No complete meter interval	Unavailable	No extrapolated energy silently added
Interrupted service	No demand/sales baseline	Unpriced exposure	No invented lost revenue

Canonical basis: v6.9 8.36 pattern · EV extrapolation · **Question:** How much charging energy was delivered, and what power limits mattered?
Preserved: Canonical root ownership, bounded claims, explicit evidence quality and contextual drill-down.
Adapted: Populated example data and a concise operator-first hierarchy. Technical detail remains available through evidence and analysis.
Deferred: Capabilities without a supporting data contract stay outside the implemented demo slice.

Kobo Mini-grid

Simulated site · MG-DEMO-01

Performance · delivered load and service claim limits

Service assessment: Unknown Delivered power is observed; requested-service baseline is incomplete

Delivered load	Interruptions seen	Clinic (critical)	Unserved energy
30 kW	None	4 kW	Unknown
Sum of three feeder meters	In readings only; 40 of 60 min between readings	Delivered; what it needed is not measured	Needs demand or request evidence

Where the power went

Delivered is measured · needed is not

Delivered power per feeder, average of the selected hour. The hatched bar is the missing half of a service judgement.

Delivered power by addressed load

LOAD	ROLE	OBSERVED POWER	REQUIRED-SERVICE EVIDENCE	ASSESSMENT
Residential feeder	General service	18 kW	No supported demand baseline	Unknown
Clinic	Critical service	4 kW	Instrumented request source not yet available	Unknown
Grain mill	Productive use	8 kW	Schedule/request evidence required	Unknown

What is supported

The three meters report delivered power. These values describe supply to the loads during measured intervals; they do not independently establish what customers required.

What unlocks a service conclusion

For controllable clinic loads, pair a reported requested-power record with delivered power. For passive loads, use evidenced service availability or a labelled demand model.

See effect on verification →

Canonical basis: v6.9 8.20 · **Question:** Was required load service delivered?
Preserved: Canonical root ownership, bounded claims, explicit evidence quality and contextual drill-down.
Adapted: An honest service gap replaces an unsupported 100% served-energy metric.
Deferred: Precise unserved kWh without requested-service evidence.
Content owners: ServiceWindow · LoadRequestEvidence · AcceptedEvidence · **Prototype route:** #/service

Kobo Mini-grid

Simulated site · MG-DEMO-01

Performance · fuel reconciliation and uncertainty

Fuel balance: evidence limited — Illustrates the minimum balance terms; no residual conclusion yet

Opening evidence	Recorded deliveries	Expected use	Residual
200 L	Unknown	4.9–5.9 L	Unavailable
Reported tank level at selected start	Absence of record does not prove none occurred	Modelled: 18 kW for 60 min × 0.30 L/kWh ± 10%	Closing corroboration and delivery completeness needed

Fuel balance at a glance

Opening + deliveries − use − closing

Opening tank	200 L
+ Deliveries	Unknown
− Generator use	4.9–5.9 L
− Closing tank	Unknown
= Unexplained	Cannot compute

Hatched bars are missing evidence. A residual is shown only when every term has a supported range.

Balance bridge

TERM	EVIDENCE BASIS	TREATMENT
Opening inventory	Tank level reading	Retain sensor uncertainty
Plus deliveries	Delivery / operator records	Missing completeness blocks precise reconciliation
Less generator consumption	Measured output × configured coefficient	Modelled range, not fuel-meter reading
Less closing inventory	Tank reading / witnessed dip	Require a supported closing bound
Unexplained residual	Opening + delivery − use − closing	Compare with combined uncertainty; never infer theft

ⓘ A fuel residual is unexplained inventory movement with uncertainty. It cannot establish theft or be added automatically to dispatch-associated fuel exposure.

Inspect existing generator fuel interpretation

The dispatch Finding already has a bounded modelled fuel quantity for Candidate portions. This is a separate technical interpretation from a complete fuel-inventory balance.

Open dispatch consequence | Inspect fuel basis ↗

Canonical basis: v6.9 8.22 · **Question:** Can the fuel inventory movement be reconciled?
Preserved: Residual, uncertainty and expected-consumption basis stay explicit.
Adapted: Shows the missing-evidence state instead of inventing a fuel-loss story for Kobo.
Deferred: Fuel ERP and theft detection.
Content owners: FuelBalanceWindow · OperationalRecord · AcceptedEvidence · **Prototype route:** #/fuel

Kobo Mini-grid

Simulated site · MG-DEMO-01

Performance · backup start and service recovery

Backup readiness: Unknown Generator operation alone is not a witnessed start-and-recovery test

Outages in window	Start success	Last witnessed test	Critical service recovery
0	Unknown	No record	Unknown
No supply interruption seen	No outage to respond to	Test history not connected	Clinic need not measured

Backup event chains

Same chain as the cold-room Backup view: grid → start → generator → power → load → service

WHEN	GRID	START REQUESTED	GENERATOR	POWER TO LOAD	LOAD RESPONSE	OUTCOME FOR SERVICE	RESULT
No outage in the selected hour	—	—	—	—	—	—	No event

Backup readiness evidence

REQUIRED STEP	AVAILABLE EVIDENCE	CURRENT CLAIM
Supply interruption	No complete backup event in selected hour	No outage-chain assessment
Start command and state	Historical generator state reports	Operation observed; test not established
Power restored to critical service	Clinic delivered-power series	Requested-service baseline missing
Witnessed outcome	No accepted test record	Readiness remains unverified

Operating evidence

The generator is observed running in the selected dispatch period. This supports runtime reconstruction, not a general claim that automatic backup will succeed on demand.

Open Dispatch →

Next evidence

Run a witnessed start-to-service test and retain command, generator state, power-path and critical-service observations.

Open Actions →

Canonical basis: v6.9 8.24 · **Question:** What does the evidence say about backup readiness?
Preserved: Canonical root ownership, bounded claims, explicit evidence quality and contextual drill-down.
Adapted: Populated example data and a concise operator-first hierarchy. Technical detail remains available through evidence and analysis.
Deferred: Capabilities without a supporting data contract stay outside the implemented demo slice.
Content owners: BackupEventChain · ServiceWindow · CapabilityReadiness · **Prototype route:** #/backup

ⓘ Source connectivity is not physical asset health. Evidence Full/Limited/None/N-A is a separate vocabulary from Healthy/Watch/Degraded.

Canonical basis: v6.9 8.8 · 8.35 · **Question:** Where do evidence gaps constrain estate-wide decisions?
Preserved: Global roll-up links down to site-owned readiness.
Adapted: Compact domain-capability matrix for three sites.
Deferred: A duplicate global raw-record browser.
Content owners: PortfolioEvidenceMatrix · CapabilityReadiness · **Prototype route:** #/globalevidence

Financials

Portfolio financials

Estate consequences with source-site ownership and bounded interpretation

Site-owned consequences — Values grouped by basis and period; no financial assessment

Consequence register

No independent repricing or technical re-derivation

SITE	CATEGORY	WINDOW / QUANTITY	VALUE	BASIS / LIMIT	SOURCE
Kobo	Candidate operating-cost exposure	6 Oct · 14:20–15:20	$3.31–3.97	Modelled fuel + scenario accrual	**Site bridge →**
GreenHarvest	Potential product exposure	6 Oct · backup excursion	Unpriced	Stock / product loss not established	**Site evidence →**
Depot	Gross tariff estimate	6 Oct · 08:00–16:00 · 120 kWh	$36.00	Scenario tariff; not collections	**Site bridge →**

ⓘ These values are not an additive profit or savings total. Categories, time periods, uncertainty and overlapping technical bases differ.

Aggregation rule

Aggregate distinct eligible consequence-line IDs by category, currency and compatible window. Reuse the exact site consequence revision; preserve exclusions and assumption references.

Canonical basis: v6.9 8.9 · 8.36 · **Question:** What consequences are supported across the estate?
Preserved: Canonical root ownership, bounded claims, explicit evidence quality and contextual drill-down.
Adapted: Populated example data and a concise operator-first hierarchy. Technical detail remains available through evidence and analysis.
Deferred: Capabilities without a supporting data contract stay outside the implemented demo slice.

Kobo Mini-grid

Simulated site · MG-DEMO-01

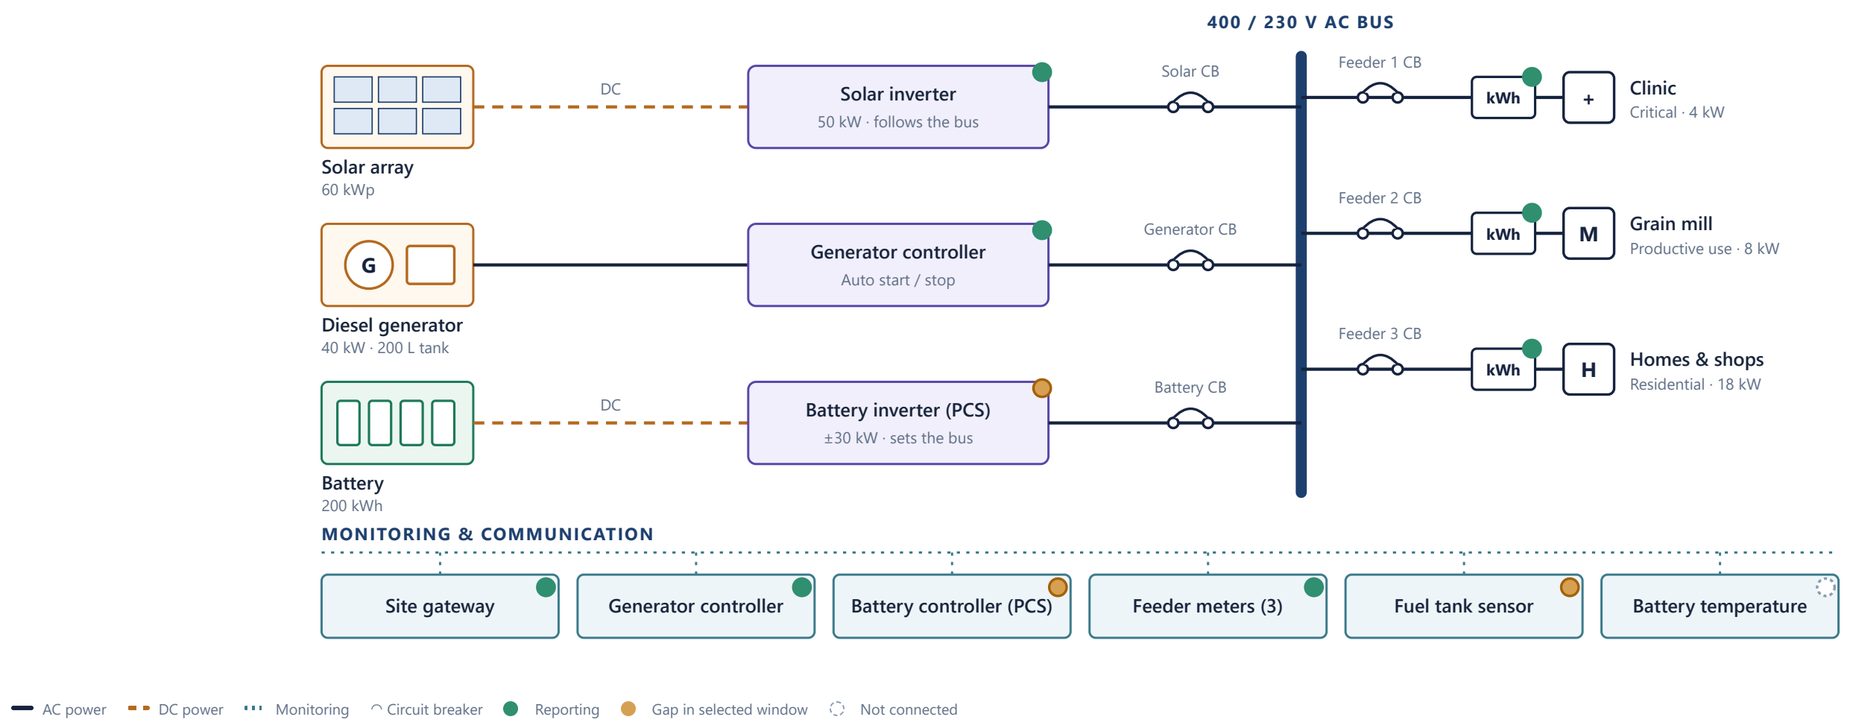

Foundation · single line diagram

Configured site · effective 6 Oct 2026 — Single line diagram · what is connected to what, and which parts report evidence

Site evidence →

Kobo Mini-grid · AC-coupled mini-grid

Configured equipment, protection and metering · reporting status for the event window, not live power flow

What each part does

PART	ROLE AT THIS SITE	WHAT IT REPORTS
Solar array + inverter	Daytime supply; follows the bus set by the battery inverter	Output and available power
Diesel generator	Backup and battery charging; starts at 35%, stops at 90% battery charge	Status and output every 15 min
Battery + inverter (PCS)	Holds the bus voltage; stores solar and generator energy	Charge every 15 min · output-limit report missing at 14:50
Feeders 1–3	Clinic is the critical supply; mill is productive use	Delivered power per feeder

ⓘ This is the configured site, not a live view. Ratings come from the site model; reporting dots come from accepted evidence. Opening a component moves you to its asset page.

Canonical basis: v6.9 8.10 · 8.12 (structure) · **Question:** How is the site connected, and which parts report evidence?
Preserved: Canonical root ownership, bounded claims, explicit evidence quality and contextual drill-down.
Adapted: v6.9 8.12 is the Simulator Lab site view; its structure (sources, breakers, bus, loads) is reused as a product view with reporting status instead of live flows or controls.
Deferred: Capabilities without a supporting data contract stay outside the implemented demo slice.

Operational records

Operational records

Operator logs, manual readings, shift notes and site visits

Records in window	Feeding evidence	In review	Requested, not yet done
6	6	1	2
Logs, readings, notes and visits	Labelled Operator record where used	REC-321	Closing fuel dip · stock in chamber

All | Operator log | Manual reading | Shift note | Site visit

Operational records

What people on site recorded, and the evidence each one feeds

RECORD	TYPE	SITE	WHEN	BY	WHAT IT SAYS	FEEDS	STATE
REC-305	Manual reading	Kobo	6 Oct 14:15	Site operator	Fuel tank dip: 198 L (sensor read 200 L)	Fuel balance · opening →	Accepted
REC-306	Shift note	Kobo	6 Oct 15:30	Shift supervisor	Generator left running to charge the battery; stop setting 90% unchanged	F-104 context →	Accepted
REC-307	Manual reading	Kobo	Requested	—	Closing fuel tank dip not yet taken	Fuel balance · closing →	Requested
REC-311	Operator log	GreenHarvest	6 Oct 19:14	Night operator	Generator started by hand after no automatic start	INC-203 timeline →	Accepted
REC-312	Site visit	GreenHarvest	6 Oct 21:40	Technician	Starter and control circuit inspected; connection re-made	WR-019 record →	Accepted
REC-313	Manual reading	GreenHarvest	Requested	—	Stock in chamber not recorded	Product exposure →	Requested
REC-320	Shift note	Depot	6 Oct 14:20	Depot attendant	Driver reported connector 2 stopped mid-charge; vehicle moved to connector 1	F-130 context →	Accepted
REC-321	Site visit	Depot	6 Oct 16:30	Charging technician	Connector 2 checked visually; no damage; diagnostics not exported	ACT-061 →	In review

Record a manual reading

How records are used

Records are kept apart from measured readings and are labelled **Operator record** wherever they support a conclusion.

A requested record that is never taken stays a visible gap; it is not filled in.

Canonical basis: v6.9 Owner outline · 8.33 basis (Operator record) · **Question:** What did people on site record, and what does it feed?
Preserved: Canonical root ownership, bounded claims, explicit evidence quality and contextual drill-down.
Adapted: Populated example data and a concise operator-first hierarchy. Technical detail remains available through evidence and analysis.
Deferred: Capabilities without a supporting data contract stay outside the implemented demo slice.
Content owners: OperationalRecord · **Prototype route:** #/oprecords
